Calculus Second Derivative Test Worksheet

For the following, find all relative extrema. Use the Second Derivative Test where applicable.

1) $f(x) = 6x - x^{2}$ $f(x) = 6x - x^{2}$ f'(x) = 6 - 2xf''(x) = -2

 $6-2x = 0 \Rightarrow x = 3$ f''(x) < 0, so x = 3 must be a maximum local maximum of 9 at x = 3 (also an absolute maximum)

2) $f(x) = x^2 + 3x - 8$

 $f(x) = x^{2} + 3x - 8$ f'(x) = 2x + 3 f''(x) = 2

 $2x + 3 = 0 \Rightarrow x = \frac{-3}{2}$ f''(x) > 0, so $x = \frac{-3}{2}$ must be a minimum local minimum of $-\frac{41}{4}$ at $x = \frac{-3}{2}$ (also an absolute minimum)

Name

3)
$$f(x) = -(x-5)^2$$

 $f(x) = -(x-5)^2$
 $f'(x) = -2(x-5) = -2x + 10$
 $f''(x) = -2$

 $-2x+10 = 0 \Rightarrow x = 5$ f''(x) < 0, so x = 5 must be a maximum local maximum of 0 at x = 5 (also an absolute maximum)

4) $f(x) = x^{2/3} - 3$ $f(x) = x^{2/3} - 3$ $f'(x) = \frac{2}{3}x^{-1/3} = \frac{2}{3x^{1/3}}$ $f''(x) = -\frac{2}{9}x^{-4/3}$

 $\frac{2}{3x^{1/3}} = 0$ does not exist, but f'' is undefined at x = 0f''(0) does not exist. We must use a different test.

First Derivative Test:

x	-1	0	1
f'	$-\frac{2}{3}$	DNE	$\frac{2}{3}$

Local minimum of -3 at x = 0 (also an absolute minimum)

5)
$$f(x) = \sqrt{x^2 + 1}$$

 $f(x) = \sqrt{x^2 + 1}$ Domain: all reals
 $f'(x) = \frac{1}{2}(x^2 + 1)^{-1/2}(2x) = \frac{x}{\sqrt{x^2 + 1}}$
 $f''(x) = -\frac{1}{4}(x^2 + 1)^{-3/2}(2x)(2x) + 2(\frac{1}{2}(x^2 + 1)^{-1/2}) = \frac{1}{\sqrt{x^2 + 1}} - \frac{x^2}{\sqrt{(x^2 + 1)^3}}$

 $\frac{x}{\sqrt{x^2 + 1}} = 0 \text{ at } x = 0$ f''(0) = 1 , so x = 0 is a minimumlocal minimum of 1 at x = 0 (also an absolute minimum) 6) $f(x) = x + \frac{4}{x}$

$$f(x) = x + \frac{4}{x}$$
 Domain: all reals except $x = 0$
$$f'(x) = 1 - \frac{4}{x^2} = \frac{x^2 - 4}{x^2}$$

$$f''(x) = \frac{8}{x^3}$$

 $\frac{x^2 - 4}{x^2} = 0 \text{ at } x = 2 \text{ or } x = -2$ f''(2) = 1 , so x = 0 is a minimum; f''(-2) = -1 , so x = 0 is a maximumlocal minimum of 4 at x = 2; local maximum of -4 at x = -2 For the following, find all relative extrema, points of inflection, and intervals of concavity. Then use a graphing calculator to graph the function and confirm you answers.

7) $f(x) = x^{3} - 12x$ $f(x) = x^{3} - 12x$ $f'(x) = 3x^{2} - 12$ f''(x) = 6x

 $3x^2 - 12 = 0 \Rightarrow x = \pm 2$ $f''(-2) = -12 \Rightarrow \text{local max local max of 16 at } x = -2$ $f''(2) = 12 \Rightarrow \text{local min local min of -16 at } x = 2$

 $6x = 0 \Rightarrow x = 0$ (0,0) is a point of inflection concave down on (- ∞ , 0), concave up on (0, ∞)

8)
$$f(x) = \frac{1}{4}x^{4} - 2x^{2}$$
$$f(x) = \frac{1}{4}x^{4} - 2x^{2}$$
$$f'(x) = x^{3} - 4x$$
$$f''(x) = 3x^{2} - 4$$

 $x^3 - 4x = 0 \Rightarrow x = 0, \pm 2$ $f''(-2) = 8 \Rightarrow \text{local min local min of } -4 \text{ at } x = -2$ $f''(0) = -4 \Rightarrow \text{local max local max of } 0 \text{ at } x = 0$ $f''(2) = 8 \Rightarrow \text{local min local min of } -4 \text{ at } x = 2$

$$3x^{2} - 4 = 0 \Rightarrow x = \pm \sqrt{\frac{4}{3}} \quad \left(\pm \sqrt{\frac{4}{3}}, -\frac{20}{9}\right) \text{ are points of inflection}$$

concave up on $\left(-\infty, -\sqrt{\frac{4}{3}}\right)$, concave down on $\left(-\sqrt{\frac{4}{3}}, \sqrt{\frac{4}{3}}\right)$, concave up on $\left(\sqrt{\frac{4}{3}}, \infty\right)$

9)
$$f(x) = x\sqrt{x+3}$$

 $f(x) = x\sqrt{x+3}$ Domain: $[-3,\infty)$
 $f'(x) = \sqrt{x+3} + x\left(\frac{1}{2}(x+3)^{-1/2}\right) = \frac{3x+6}{2\sqrt{x+3}}$
 $f''(x) = \frac{(2\sqrt{x+3})(3) - (3x+6)(x+3)^{-1/2}}{4x+12}$

$$f'(x) = 0 \Rightarrow \frac{3x+6}{2\sqrt{x+3}} = 0 \Rightarrow x = -2$$

$$f''(-2) = \frac{6\sqrt{1}-0}{4} > 0, \text{ so local min at } x = -2 \text{ (also abs min)}$$

$$f(-3) = 0, \text{ so local max at } x = -3$$

$$f''(x) = 0 \Rightarrow \left(2\sqrt{x+3}\right)(3) - \left(3x+6\right)(x+3)^{-1/2} = 0$$

$$\Rightarrow \frac{6x+18-(3x+6)}{\sqrt{x+3}} = 0$$

$$\Rightarrow 3x+12 = 0 \Rightarrow x = -4 \text{ (this is out of the domain)}$$

convex up on $(-3,\infty)$
