

## 2.1 Linear Equations in One Variable

### Objectives

- 1 Distinguish between expressions and equations.
- 2 Identify linear equations, and decide whether a number is a solution of a linear equation.
- 3 Solve linear equations by using the addition and multiplication properties of equality.
- 4 Solve linear equations by using the distributive property.
- 5 Solve linear equations with fractions or decimals.
- 6 Identify conditional equations, contradictions, and identities.

### Distinguish between expressions and equations.

Equations and inequalities compare algebraic expressions.

An **equation** is a statement that two algebraic expressions are equal.

**An equation always contains an equals symbol, while an expression does not.**

Slide 2.1- 2

### CLASSROOM EXAMPLE 1

#### Distinguishing between Expressions and Equations

Decide whether each of the following is an **equation** or an **expression**.

**Solution:**

$9x + 10 = 0$       **equation**

$9x + 10$       **expression**

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1- 3

### Objective 2

**Identify linear equations, and decide whether a number is a solution of a linear equation.**

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1- 4

**Identify linear equations, and decide whether a number is a solution of a linear equation.**

#### Linear Equation in One Variable

A **linear equation in one variable** can be written in the form

$$Ax + B = C,$$

where  $A$ ,  $B$ , and  $C$  are real numbers, with  $A \neq 0$ .

A linear equation is a **first-degree equation**, since the greatest power on the variable is 1.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1- 5

**Identify linear equations, and decide whether a number is a solution of a linear equation.**

If the variable in an equation can be replaced by a real number that makes the statement true, then that number is a **solution** of the equation.

An equation is **solved** by finding its **solution set**, the set of all solutions.

**Equivalent equations** are related equations that have the same solution set.

Slide 2.1- 6

### Objective 3

Solve linear equations by using the addition and multiplication properties of equality.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-7

Solve linear equations by using the addition and multiplication properties of equality.

#### Addition and Multiplication Properties of Equality

##### Addition Property of Equality

For all real numbers  $A$ ,  $B$ , and  $C$ , the equations

$$A = B \quad \text{and} \quad A + C = B + C$$

are equivalent.

That is, *the same number may be added to each side of an equation without changing the solution set.*

##### Multiplication Property of Equality

For all real numbers  $A$ , and  $B$ , and for  $C \neq 0$ , the equations

$$A = B \quad \text{and} \quad AC = BC$$

are equivalent.

That is, *each side of the equation may be multiplied by the same nonzero number without changing the solution set.*

Slide 2.1-8

#### CLASSROOM EXAMPLE 2 Using the Properties of Equality to Solve a Linear Equation

Solve.

$$4x + 8x = -9 + 17x - 1$$

**Solution:**

The goal is to isolate  $x$  on one side of the equation.

$$12x = -10 + 17x \quad \text{Combine like terms.}$$

$$12x - 17x = -10 + 17x - 17x \quad \text{Subtract } 17x \text{ from each side.}$$

$$\frac{-5x}{-5} = \frac{-10}{-5} \quad \text{Divide each side by } -5.$$

$$x = 2$$

Check  $x = 2$  in the original equation.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-9

#### CLASSROOM EXAMPLE 2 Using the Properties of Equality to Solve a Linear Equation (cont'd)

Check  $x = 2$  in the original equation.

$$4x + 8x = -9 + 17x - 1$$

$$4(2) + 8(2) = -9 + 17(2) - 1$$

$$8 + 16 = -9 + 34 - 1$$

$$24 = 24$$

Use parentheses around substituted values to avoid errors.

This is NOT the solution.

The true statement indicates that  $\{2\}$  is the solution set.

Slide 2.1-10

Solve linear equations by using the addition and multiplication properties of equality.

#### Solving a Linear Equation in One Variable

- Step 1** **Clear fractions or decimals.** Eliminate fractions by multiplying each side by the least common denominator. Eliminate decimals by multiplying by a power of 10.
- Step 2** **Simplify each side separately.** Use the distributive property to clear parentheses and combine like terms as needed.
- Step 3** **Isolate the variable terms on one side.** Use the addition property to get all terms with variables on one side of the equation and all numbers on the other.
- Step 4** **Isolate the variable.** Use the multiplication property to get an equation with just the variable (with coefficient 1) on one side.
- Step 5** **Check.** Substitute the proposed solution into the original equation.

Slide 2.1-11

### Objective 4

Solve linear equations by using the distributive property.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-12

**CLASSROOM EXAMPLE 3** Using the Distributive Property to Solve a Linear Equation

Solve.

$$6 - (4 + x) = 8x - 2(3x + 5)$$

**Solution:**

**Step 1** Since there are no fractions in the equation, **Step 1** does not apply.

**Step 2** Use the distributive property to simplify and combine like terms on the left and right.

$$6 - (1)4 - (1)x = 8x - 2(3x) + (-2)(5) \quad \text{Distributive property.}$$

$$6 - 4 - x = 8x - 6x - 10 \quad \text{Multiply.}$$

$$2 - x = 2x - 10 \quad \text{Combine like terms.}$$

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-13

**CLASSROOM EXAMPLE 3** Using the Distributive Property to Solve a Linear Equation (cont'd)

**Step 3** Next, use the addition property of equality.

$$2 - 2 - x = 2x - 10 - 2 \quad \text{Subtract 2.}$$

$$-x = 2x - 12 \quad \text{Combine like terms.}$$

$$-x - 2x = 2x - 2x - 12 \quad \text{Subtract 2x}$$

$$-3x = -12 \quad \text{Combine like terms.}$$

**Step 4** Use the multiplication property of equality to isolate  $x$  on the left side.

$$\frac{-3x = -12}{-3 \quad -3}$$

$$x = 4$$

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-14

**CLASSROOM EXAMPLE 3** Using the Distributive Property to Solve a Linear Equation (cont'd)

**Step 5** Check.  $6 - (4 + x) = 8x - 2(3x + 5)$

$$6 - (4 + 4) = 8(4) - 2(3(4) + 5)$$

$$6 - 8 = 32 - 2(12 + 5)$$

$$-2 = 32 - 2(17)$$

$$-2 = 32 - 34$$

$$-2 = -2 \quad \text{True}$$

The solution checks, so  $\{4\}$  is the solution set.

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-15

**CLASSROOM EXAMPLE 4** Solving a Linear Equation with Fractions

Solve.

$$\frac{x+1}{2} + \frac{x+3}{4} = \frac{1}{2}$$

**Solution:**

**Step 1** Start by eliminating the fractions. Multiply both sides by the LCD.

$$4\left(\frac{x+1}{2} + \frac{x+3}{4}\right) = 4\left(\frac{1}{2}\right)$$

**Step 2**

$$4\left(\frac{x+1}{2}\right) + 4\left(\frac{x+3}{4}\right) = 4\left(\frac{1}{2}\right) \quad \text{Distributive property.}$$

$$\frac{4(x+1)}{2} + \frac{4(x+3)}{4} = 2 \quad \text{Multiply; 4.}$$

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-16

**CLASSROOM EXAMPLE 4** Solving a Linear Equation with Fractions (cont'd)

$$\frac{4(x+1)}{2} + \frac{4(x+3)}{4} = 2$$

$$2(x+1) + x + 3 = 2$$

$$2(x) + 2(1) + x + 3 = 2 \quad \text{Distributive property.}$$

$$2x + 2 + x + 3 = 2 \quad \text{Multiply.}$$

$$3x + 5 = 2 \quad \text{Combine like terms.}$$

**Step 3**  $3x + 5 - 5 = 2 - 5$  Subtract 5.

$$3x = -3 \quad \text{Combine like terms.}$$

**Step 4**  $\frac{3x}{3} = \frac{-3}{3}$  Divide by 3.

$$x = -1$$

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-17

**CLASSROOM EXAMPLE 4** Solving a Linear Equation with Fractions (cont'd)

**Step 5** Check.

$$\frac{(x+1)}{2} + \frac{(x+3)}{4} = \frac{1}{2}$$

$$\frac{(x+1)}{2} + \frac{(x+3)}{4} = \frac{1}{2}$$

$$\frac{(-1+1)}{2} + \frac{(-1+3)}{4} = \frac{1}{2}$$

$$\frac{0}{2} + \frac{2}{4} = \frac{1}{2}$$

$$\frac{1}{4} = \frac{1}{4}$$

The solution checks, so the solution set is  $\{-1\}$ .

Copyright © 2012, 2008, 2004, Pearson Education, Inc. Slide 2.1-18

**CLASSROOM EXAMPLE 5** Solving a Linear Equation with Decimals

Solve.

$$0.02(60) + 0.04x = 0.03(50 + x)$$

**Solution:**

$$2(60) + 4x = 3(50 + x)$$

$$120 + 4x = 150 + 3x$$

$$120 - 120 + 4x = 150 - 120 + 3x$$

$$4x = 30 + 3x$$

$$4x - 3x = 30 + 3x - 3x$$

$$x = 30$$

Since each decimal number is given in hundredths, multiply both sides of the equation by 100.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-19

**Objective 6**

**Identify conditional equations, contradictions, and identities.**

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-20

**Identify conditional equations, contradictions, and identities.**

Type of Linear Equation	Number of Solutions	Indication when Solving
<b>Conditional</b>	One	Final line is $x = a$ number.
<b>Identity</b>	Infinite; solution set {all real numbers}	Final line is true, such as $0 = 0$ .
<b>Contradiction</b>	None; solution set $\emptyset$	Final line is false, such as $-15 = -20$ .

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-21

**CLASSROOM EXAMPLE 6** Recognizing Conditional Equations, Identities, and Contradictions

Solve each equation. Decide whether it is a **conditional equation**, an **identity**, or a **contradiction**.

$$5(x + 2) - 2(x + 1) = 3x + 1$$

**Solution:**

$$5x + 10 - 2x - 2 = 3x + 1$$

$$3x + 8 = 3x + 1$$

$$3x - 3x + 8 = 3x - 3x + 1$$

$$8 = 1 \quad \text{False}$$

The result is false, the equation has no solution. The equation is a contradiction. The solution set is  $\emptyset$ .

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-22

**CLASSROOM EXAMPLE 6** Recognizing Conditional Equations, Identities, and Contradictions (cont'd)

$$\frac{x+1}{3} + \frac{2x}{3} = x + \frac{1}{3}$$

**Solution:**

$$3\left(\frac{x+1}{3}\right) + 3\left(\frac{2x}{3}\right) = 3\left(x + \frac{1}{3}\right)$$

$$x + 1 + 2x = 3x + 1$$

$$3x + 1 = 3x + 1$$

This is an identity. Any real number will make the equation true. The solution set is {all real numbers}.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.1-23

**CLASSROOM EXAMPLE 6** Recognizing Conditional Equations, Identities, and Contradictions (cont'd)

$$5(3x + 1) = x + 5$$

**Solution:**

$$15x + 5 = x + 5$$

$$15x - x + 5 = x - x + 5$$

$$14x + 5 = 5$$

$$14x + 5 - 5 = 5 - 5$$

$$14x = 0$$

$$x = 0$$

This is a conditional equation. The solution set is {0}.
