

## 2.2 Formulas and Percent

### Objectives

- 1 Solve a formula for a specified variable.
- 2 Solve applied problems by using formulas.
- 3 Solve percent problems.
- 4 Solve problems involving percent increase or decrease.

## Formulas and Percent

A **mathematical model** is an equation or inequality that describes a real situation. Models for many applied problems, called **formulas**, already exist. A **formula** is an equation in which variables are used to describe a relationship.

A few commonly used formulas are:

$$d = rt, \quad I = prt, \quad A = \frac{1}{2}bh, \quad \text{and} \quad P = 2L + 2W$$

Distance Formula	Interest Formula	Area of a Triangle Formula	Perimeter of a Rectangle Formula
---------------------	---------------------	----------------------------------	---

Slide 2.2-2

### Objective 1

## Solve a formula for a specified variable.

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.2-3

### Solve a formula for a specified variable.

*When solving for a specified variable, the key is to treat that variable as if it were the only one. Treat all other variables like numbers (constants).*

#### Solving for a Specified Variable

- Step 1** If the equation contains fractions, multiply both sides by the LCD to clear the fractions.
- Step 2** Transform so that all terms containing the specified variable are on one side of the equation and all terms without that variable are on the other side.
- Step 3** Divide each side by the factor that is the coefficient of the specified variable.

Slide 2.2-4

### CLASSROOM EXAMPLE 1 Solving for a Specified Variable

Solve the formula  $d = rt$  for  $r$ .

**Solution:**

Solve the formula by isolating the  $r$  on one side of the equals sign.

$$\frac{d}{t} = \frac{rt}{t} \quad \text{Divide by } t.$$

$$r = \frac{d}{t}$$

Slide 2.2-5

### CLASSROOM EXAMPLE 2 Solving for a Specified Variable

Solve the formula for  $L$ .

$$P = 2L + 2W$$

**Solution:**

$$P - 2W = 2L + 2W - 2W \quad \text{Subtract } 2W \text{ from both sides.}$$

$$P - 2W = 2L \quad \text{Combine like terms.}$$

$$\frac{P - 2W}{2} = \frac{2L}{2} \quad \text{Divide both sides by } 2 \text{ to isolate } L.$$

$$L = \frac{P - 2W}{2}$$

Slide 2.2-6

**CLASSROOM EXAMPLE 3** Solving a Formula Involving Parentheses

Solve the equation for  $x$ .

$$y = \frac{1}{2}(x+3)$$

**Solution:**

$$y = \frac{x}{2} + \frac{3}{2}$$

Use distributive property on the right side to eliminate the parentheses.

$$2y = x + 3$$

Multiply both sides by 2 to eliminate fractions.

$$2y - 3 = x \quad \text{or} \quad x = 2y - 3$$

Subtract 3 from both sides.

Slide 2.2-7

**CLASSROOM EXAMPLE 4** Solving an Equation for One of the Variables

Solve the equation for  $y$ .

$$2x + 7y = 5$$

**Solution:**

$$2x + 7y - 2x = 5 - 2x$$

Subtract  $2x$  from both sides.

$$7y = 5 - 2x$$

Combine like terms.

$$y = \frac{5 - 2x}{7}$$

Divide both sides by 7.

Slide 2.2-9

**CLASSROOM EXAMPLE 5** Finding Average Rate

It takes James Harmon one third of an hour to travel 15 miles. What is his average rate?

**Solution:**

Find the rate by using the formula  $d = rt$  and solving for  $r$ .

$$15 = r \cdot \frac{1}{3}$$

Multiply both sides by 3.

$$45 = r$$

Average rate of speed is 45 mph.

Slide 2.2-10

**Solve percent problems.**

An important everyday use of mathematics involves the concept of percent. Percent is written with the symbol %. The word **percent** means "per one hundred".

$$1\% = 0.01 \quad \text{or} \quad 1\% = \frac{1}{100}$$

**Solving a Percent Problem**

Let  $a$  represent a partial amount of  $b$ , the base, or whole amount. Then the following equation can be used to solve a percent problem.

$$\frac{\text{partial amount } a}{\text{base } b} = \text{percent (represented as a decimal)}$$

Slide 2.2-11

**CLASSROOM EXAMPLE 6** Solving Percent Problems

Solve each problem.

A mixture of gasoline oil contains 20 oz, of which 1 oz is oil. What percent of the mixture is oil?

**Solution:**

The whole amount of mixture is 20 oz. The part that is oil is 1 oz.

$$x = \frac{1}{20}$$

← partial amount

← whole amount

$$x = 0.05, \quad \text{or} \quad 5\%.$$

Thus, 5% of the mixture is oil.

Slide 2.2-12

**CLASSROOM EXAMPLE 6** Solving Percent Problems (cont'd)

An automobile salesman earns an 8% commission on every car he sells. How much does he earn on a car that sells for \$12,000?

**Solution:**

Let  $x$  represent the amount of commission earned.  
 $8\% = 8 \cdot 0.01 = 0.08$

$$\frac{x}{12,000} = 0.08 \quad \frac{\text{partial}}{\text{whole}} = \text{percent}$$

$$x = 0.08(12,000) \quad \text{Multiply by 12,000.}$$

$$x = 960$$

The salesman earns \$960.

Slide 2.2-13

**CLASSROOM EXAMPLE 7** Interpreting Percents from a Graph

In 2007, Americans spent about \$41.2 billion on their pets. Use the graph to determine how much was spent on pet supplies/medicine? Round your answer to the nearest tenth of a billion dollars.

**Solution:**

Let  $x$  represent the amount spent on pet supplies/medicine.

$$\frac{x}{41.2} = 0.238$$

$$x = 0.238(41.2)$$

$$x = 9.8056$$

Therefore, about \$9.8 billion was spent on pet supplies/medicine.

Slide 2.2-14

**Objective 4**

**Solve problems involving percent increase or decrease.**

Copyright © 2012, 2008, 2004, Pearson Education, Inc.

Slide 2.2-15

**Solve problems involving percent increase or decrease.**

Percent is often used to express a change in some quantity. To solve problems of this type, we use the following form of the percent equation.

$$\text{percent change} = \frac{\text{amount of change}}{\text{base}}$$

When calculating percent increase or decrease, be sure that you use the original number (**before** the change) as the base. A common error is to use the final number (**after** the change) in the denominator of the fraction.

Slide 2.2-16

**CLASSROOM EXAMPLE 8** Solving Problems about Percent Increase or Decrease

A cost-of-living salary increase resulted in Keith's monthly salary to go from \$1300 to \$1352. What percent increase was this?

**Solution:**

Let  $x$  represent the percent increase in salary.

$$\text{percent increase} = \frac{\text{amount of change}}{\text{base}}$$

$$x = \frac{1352 - 1300}{1300}$$

$$x = \frac{52}{1300}$$

$$x = 0.04$$

The increase in salary was 4%.

Slide 2.2-17

**CLASSROOM EXAMPLE 8** Solving Problems about Percent Increase or Decrease (cont'd)

The price of a concert ticket was changed from \$54.00 to \$51.30. What percent decrease was this?

**Solution:**

Let  $x$  represent the percent decrease in ticket price.

$$\text{percent decrease} = \frac{\text{amount of change}}{\text{base}}$$

$$x = \frac{54.00 - 51.30}{54.00}$$

$$x = \frac{2.70}{54.00}$$

$$x = 0.05$$

The decrease in ticket price was 5%.
