### Find roots of numbers.

The opposite (or inverse) of **squaring** a number is taking its **square root**.

$$\sqrt{36} = 6, \text{ because } 6^2 = 36.$$

We now extend our discussion of roots to include **cube roots**  $\sqrt[3]{\phantom{a}}$ , **fourth roots**  $\sqrt[4]{\phantom{a}}$ , and higher roots.

The  $n$ th root of  $a$ , written  $\sqrt[n]{a}$ , is a number whose  $n$ th power equals  $a$ . That is,

$$\sqrt[n]{a} = b \text{ means } b^n = a.$$

### Find roots of numbers.

The number  $a$  is the **radicand**.  
 $n$  is the **index** or **order**.  
 The expression is the **radical**.

$$\sqrt[4]{256} = 4, \text{ because } 4^4 = 256$$

$$\sqrt[5]{243} = 3, \text{ because } 3^5 = 243$$

$$\sqrt[4]{\frac{16}{81}} = \frac{2}{3}, \text{ because } \left(\frac{2}{3}\right)^4 = \frac{16}{81}$$

$$\sqrt[3]{0.064} = 0.4, \text{ because } 0.4^3 = 0.064$$

### Find principal roots.

#### $n$ th Root

**Case 1** If  $n$  is **even** and  $a$  is **positive or 0**, then

$\sqrt[n]{a}$  represents the **principal  $n$ th root** of  $a$ ,

$-\sqrt[n]{a}$  represents the **negative  $n$ th root** of  $a$ .

**Case 2** If  $n$  is **even** and  $a$  is **negative**, then

$\sqrt[n]{a}$  is not a real number.

**Case 3** If  $n$  is **odd**, then

there is exactly one real  $n$ th root of  $a$ , written  $\sqrt[n]{a}$ .

**Use the Pythagorean theorem.**

**Pythagorean Theorem**

If  $c$  is the length of the longest side of a right triangle and  $a$  and  $b$  are lengths of the shorter sides, then

$$c^2 = a^2 + b^2.$$

The longest side is the **hypotenuse**, and the two shorter sides are the **legs**, of the triangle. The hypotenuse is the side opposite the right angle.

**CLASSROOM EXAMPLE 8**

**Using the Pythagorean Theorem**

Find the length of the unknown side of the triangle.

**Solution:**

$$c^2 = a^2 + b^2$$

$$c^2 = 14^2 + 8^2$$

$$c^2 = 196 + 64$$

$$c^2 = 260$$

$$c = \sqrt{260}$$

$$c = \sqrt{4 \cdot 65}$$

$$c = \sqrt{4} \cdot \sqrt{65}$$

$$c = 2\sqrt{65}$$

The length of the hypotenuse is  $2\sqrt{65}$ .

**CLASSROOM EXAMPLE 8**

**Using the Pythagorean Theorem (cont'd)**

Find the length of the unknown side of the triangle.

**Solution:**

$$c^2 = a^2 + b^2$$

$$6^2 = 4^2 + b^2$$

$$36 = 16 + b^2$$

$$20 = b^2$$

$$\sqrt{20} = b$$

$$\sqrt{4 \cdot 5} = b$$

$$\sqrt{4} \cdot \sqrt{5} = b$$

$$2\sqrt{5} = b$$

The length of the leg is  $2\sqrt{5}$ .

**Use the distance formula.**

**Distance Formula**

The distance between points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

**CLASSROOM EXAMPLE 9**

**Using the Distance Formula**

Find the distance between each pair of points.

$(2, -1)$  and  $(5, 3)$

**Solution:**

Designate which points are  $(x_1, y_1)$  and  $(x_2, y_2)$ .

$(x_1, y_1) = (2, -1)$  and  $(x_2, y_2) = (5, 3)$

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$d = \sqrt{(5 - 2)^2 + (3 - (-1))^2}$$

$$d = \sqrt{(3)^2 + (4)^2}$$

$$d = \sqrt{9 + 16}$$

$$d = \sqrt{25} = 5$$

Start with the  $x$ -value and  $y$ -value of the same point.

**CLASSROOM EXAMPLE 9**

**Using the Distance Formula (cont'd)**

Find the distance between each pairs of points.

$(-3, 2)$  and  $(0, -4)$

**Solution:**

Designate which points are  $(x_1, y_1)$  and  $(x_2, y_2)$ .

$(x_1, y_1) = (-3, 2)$  and  $(x_2, y_2) = (0, -4)$

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

$$d = \sqrt{(0 - (-3))^2 + (-4 - 2)^2}$$

$$d = \sqrt{(3)^2 + (-6)^2}$$

$$d = \sqrt{9 + 36}$$

$$d = \sqrt{45} = 3\sqrt{5}$$

### Rationalize denominators with one radical.

#### Rationalizing the Denominator

A common way of "standardizing" the form of a radical expression is to have the denominator contain no radicals. The process of removing radicals from a denominator so that the denominator contains only rational numbers is called **rationalizing the denominator**. This is done by multiplying by a form of 1.

### Solve radical equations by using the power rule.

#### Power Rule for Solving an Equation with Radicals

If both sides of an equation are raised to the same power, all solutions of the original equation are also solutions of the new equation.

**The power rule does not say that all solutions of the new equation are solutions of the original equation.** They may or may not be. Solutions that do not satisfy the **original** equation are called **extraneous solutions**. They must be rejected.

When the power rule is used to solve an equation, **every solution of the new equation must be checked in the original equation.**

PEARSON

Simplify numbers of the form  $\sqrt{-b}$ , where  $b > 0$ .

### Imaginary Unit $i$

The imaginary unit  $i$  is defined as

$$i = \sqrt{-1}, \text{ where } i^2 = -1.$$

That is,  $i$  is the principal square root of  $-1$ .

Slide 8.7-2

Simplify numbers of the form  $\sqrt{-b}$ , where  $b > 0$ .

$$\sqrt{-b}$$

For any positive real number  $b$ ,  $\sqrt{-b} = i\sqrt{b}$ .

It is easy to mistake  $\sqrt{2i}$  for  $\sqrt{2i}$  with the  $i$  under the radical. For this reason, we usually write  $\sqrt{2i}$  as  $i\sqrt{2}$ , as in the definition of  $\sqrt{-b}$ .

### CLASSROOM EXAMPLE 2

### Multiplying Square Roots of Negative Numbers

Multiply.

**Solution:**

$$\sqrt{-16} \cdot \sqrt{-25} = i\sqrt{16} \cdot i\sqrt{25} \qquad \sqrt{-8} \cdot \sqrt{-6} = i\sqrt{8} \cdot i\sqrt{6}$$

$$= i \cdot 4 \cdot i \cdot 5 \qquad = i^2 \sqrt{8 \cdot 6}$$

$$= 20i^2 \qquad = i^2 \sqrt{48}$$

$$= 20(-1) \qquad = i^2 \sqrt{16 \cdot 3}$$

$$= -20 \qquad = -4\sqrt{3}$$

$$\sqrt{-6} \cdot \sqrt{-5} = i\sqrt{6} \cdot i\sqrt{5} \qquad \sqrt{-5} \cdot \sqrt{7} = i\sqrt{5} \cdot \sqrt{7}$$

$$= i^2 \sqrt{6 \cdot 5} \qquad = i\sqrt{35}$$

$$= (-1)\sqrt{30}$$

$$= -\sqrt{30}$$

$$\frac{\sqrt{-80}}{\sqrt{-5}} = \frac{i\sqrt{80}}{i\sqrt{5}} \qquad \frac{\sqrt{-40}}{\sqrt{10}} = \frac{i\sqrt{40}}{\sqrt{10}}$$

$$= \frac{\sqrt{80}}{\sqrt{5}} \qquad = i\sqrt{\frac{40}{10}}$$

$$= \sqrt{16} \qquad = i\sqrt{4}$$

$$= 4 \qquad = 2i$$

Slide 8.7-6

### Recognize subsets of the complex numbers.

For a complex number  $a + bi$ , if  $b = 0$ , then  $a + bi = a$ , which is a real number. In which case  $a$  is **real part** and  $b$  is **imaginary part**.

**Thus, the set of real numbers is a subset of the set of complex numbers.**

If  $a = 0$  and  $b \neq 0$ , the complex number is said to be a **pure imaginary number**.

For example,  $3i$  is a pure imaginary number. A number such as  $7 + 2i$  is a **nonreal complex number**.

A complex number written in the form  $a + bi$  is in **standard form**.
