**DEFINITION Function**

A **function**  $f$  is a rule that assigns to each value  $x$  in a set  $D$  a *unique* value denoted  $f(x)$ . The set  $D$  is the **domain** of the function. The **range** is the set of all values of  $f(x)$  produced as  $x$  varies over the domain (Figure 1.1).

---

---

---

---

Figure 1.2

2

---

---

---

---

---

---

---

---

**Vertical Line Test**

A graph represents a function if and only if it passes the **vertical line test**: Every vertical line intersects the graph at most once. A graph that fails this test does not represent a function.

**DEFINITION Composite Functions**

Given two functions  $f$  and  $g$ , the composite function  $f \circ g$  is defined by  $(f \circ g)(x) = f(g(x))$ . It is evaluated in two steps:  $y = f(u)$ , where  $u = g(x)$ . The domain of  $f \circ g$  consists of all  $x$  in the domain of  $g$  such that  $u = g(x)$  is in the domain of  $f$  (Figure 1.8).

**DEFINITION Symmetry in Graphs**

A graph is **symmetric with respect to the y-axis** if whenever the point  $(x, y)$  is on the graph, the point  $(-x, y)$  is also on the graph. This property means that the graph is unchanged when reflected about the y-axis (Figure 1.13a).

A graph is **symmetric with respect to the x-axis** if whenever the point  $(x, y)$  is on the graph, the point  $(x, -y)$  is also on the graph. This property means that the graph is unchanged when reflected about the x-axis (Figure 1.13b).

A graph is **symmetric with respect to the origin** if whenever the point  $(x, y)$  is on the graph, the point  $(-x, -y)$  is also on the graph (Figure 1.13c). Symmetry about both the x- and y-axes implies symmetry about the origin, but not vice versa.

**DEFINITION Symmetry in Functions**

An **even function**  $f$  has the property that  $f(-x) = f(x)$ , for all  $x$  in the domain. The graph of an even function is symmetric about the  $y$ -axis. Polynomials consisting of only even powers of the variable (of the form  $x^{2n}$ , where  $n$  is a nonnegative integer) are even functions.

An **odd function**  $f$  has the property that  $f(-x) = -f(x)$ , for all  $x$  in the domain. The graph of an odd function is symmetric about the origin. Polynomials consisting of only odd powers of the variable (of the form  $x^{2n+1}$ , where  $n$  is a nonnegative integer) are odd functions.

---

---

---

---

---

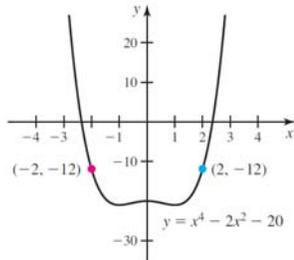

---

---

---

Figure 1.14

Even function—if  $(x, y)$  is on the graph, then  $(-x, y)$  is on the graph.

9

---

**SUMMARY Transformations**

Given the real numbers  $a$ ,  $b$ ,  $c$ , and  $d$  and the function  $f$ , the graph of  $y = cf(a(x - b)) + d$  is obtained from the graph of  $y = f(x)$  in the following steps.

$$y = f(x) \xrightarrow[\text{horizontal shift by } b \text{ units}]{\text{horizontal scaling by a factor of } |a|} y = f(ax)$$

$$\xrightarrow[\text{vertical scaling by a factor of } |c|]{\text{horizontal shift by } b \text{ units}} y = f(a(x - b))$$

$$\xrightarrow[\text{vertical shift by } d \text{ units}]{\text{vertical scaling by a factor of } |c|} y = cf(a(x - b))$$

$$\xrightarrow[\text{vertical shift by } d \text{ units}]{\text{vertical scaling by a factor of } |c|} y = cf(a(x - b)) + d$$

**DEFINITION Trigonometric Functions**

Let  $P(x, y)$  be a point on a circle of radius  $r$  associated with the angle  $\theta$ . Then

$$\begin{aligned} \sin \theta &= \frac{y}{r} & \cos \theta &= \frac{x}{r} & \tan \theta &= \frac{y}{x} \\ \cot \theta &= \frac{x}{y} & \sec \theta &= \frac{r}{x} & \csc \theta &= \frac{r}{y} \end{aligned}$$

**Trigonometric Identities**

**Reciprocal Identities**

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{1}{\tan \theta} = \frac{\cos \theta}{\sin \theta}$$

$$\csc \theta = \frac{1}{\sin \theta} \quad \sec \theta = \frac{1}{\cos \theta}$$

**Pythagorean Identities**

$$\sin^2 \theta + \cos^2 \theta = 1 \quad 1 + \cot^2 \theta = \csc^2 \theta \quad \tan^2 \theta + 1 = \sec^2 \theta$$

**Double- and Half-Angle Formulas**

$$\sin 2\theta = 2 \sin \theta \cos \theta \quad \cos 2\theta = \cos^2 \theta - \sin^2 \theta$$

$$\cos^2 \theta = \frac{1 + \cos 2\theta}{2} \quad \sin^2 \theta = \frac{1 - \cos 2\theta}{2}$$

23

---

---

---

---

---

---

---

---

**Period of Trigonometric Functions**

The functions  $\sin \theta$ ,  $\cos \theta$ ,  $\sec \theta$ , and  $\csc \theta$  have a period of  $2\pi$ :

$$\sin(\theta + 2\pi) = \sin \theta \quad \cos(\theta + 2\pi) = \cos \theta$$

$$\sec(\theta + 2\pi) = \sec \theta \quad \csc(\theta + 2\pi) = \csc \theta,$$

for all  $\theta$  in the domain.

The functions  $\tan \theta$  and  $\cot \theta$  have a period of  $\pi$ :

$$\tan(\theta + \pi) = \tan \theta \quad \cot(\theta + \pi) = \cot \theta,$$

for all  $\theta$  in the domain.
