( $x$  of  $L(x)$  is 0 because 0.04 is closest to 0)

$$L(x) = f(x + \Delta x) = f'(x)\Delta x + f(x)$$

4)  $R(a) = ?$  (don't forget unit)  $\rightarrow Q$ ; What is Max or Min. of Revenue?

(Finding Max or Min. of Profit is the same step)

3. To find Actual Revenue from sale of 4th Unit

1)  $R(x) = x \cdot p(x)$

**Antiderivatives of  $f(x) = \text{Indefinite Integral}$**

$$\int f(x) dx = F(x) \leftrightarrow F'(x) = f(x) = \frac{d}{dx} F(x)$$

$f(x)$  is continuous.

$F(x)$  is called Antiderivative of  $f$  on an interval  $I$

if  $F'(x) = f(x)$  for all  $x$  in  $I$ .

\*Member of the family of Antiderivatives of  $F(x) = y = x^3 + C$

 $f$  is continuous on  $I$

**Definite Integral**

$$\int_a^b f(x) dx \quad a \leq x \leq b$$

This represents the area

under the curve  $y=f(x)$  bounded by  $x$ -axis

and the lines  $x=a$  and  $x=b$ .

1) Left and Right Endpoints

It's hard to find the area of a region with curved sides,

so we use the idea that the slope of tangent line by slopes of secants lines and the limit of these approximations.

Suppose we divides  $S$  into  $n$ th strips and the area  $A$  is between left and right endpoints of the rectangles. (the width  $\Delta x$  of all strips are same.)

$$** \text{ Right Endpoints} = \lim_{n \rightarrow \infty} R_n, \quad ** \text{ Left Endpoints} = \lim_{n \rightarrow \infty} L_n$$

$$\begin{aligned} \text{Area} &= \lim_{n \rightarrow \infty} R_n = \lim_{n \rightarrow \infty} [f(x_1)\Delta x + f(x_2)\Delta x + \dots + f(x_{n-1})\Delta x + f(x_n)\Delta x] \\ &= \lim_{n \rightarrow \infty} L_n = \lim_{n \rightarrow \infty} [f(x_0)\Delta x + f(x_1)\Delta x + \dots + f(x_{n-1})\Delta x] \end{aligned}$$

Ex)  $y = x^2$  is divided by four strips in  $[0, 1]$

Area=A

Using left endpoints

Using right endpoints

$$\Delta x \text{ is the width of each strip} = \frac{b-a}{n} = \frac{1-0}{4} = \frac{1}{4}$$

$$\text{The area using Left Endpoints} = \frac{1}{4} [0^2 + (\frac{1}{4})^2 + (\frac{1}{2})^2 + (\frac{3}{4})^2] = 0.21875$$

$$\text{The area using Right Endpoints} = \frac{1}{4} [(\frac{1}{4})^2 + (\frac{1}{2})^2 + (\frac{3}{4})^2 + 1^2] = 0.46875$$

$$\therefore 0.21875 < \text{the Area of } y = x^2 \text{ in } [0, 1] < 0.46875$$

2) Sample Points (Reimann Integral; Sample points)

We also find the area with using sample points (any points in each strip).

The width ( $\Delta x$ ) of all strips are same.

\*\* ( $n$ th strips)

The height if the  $i$ th rectangle to be the value of  $f(x)$  at any number  $x_i^*$  in the  $i$ th subinterval  $[x_{i-1}, x_i]$  ( $x_i = a + i \Delta x$ )

$$\begin{aligned} \text{Area} &= \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x = \lim_{n \rightarrow \infty} [f(x_1^*)\Delta x + f(x_2^*)\Delta x + \dots + f(x_n^*)\Delta x] \\ &= \int_a^b f(x) dx = F(b) - F(a) \\ &= [F(x) + C]_a^b = [F(b) + C] - [F(a) + C] \end{aligned}$$

3) Midpoint Rule

$$\int_a^b f(x) dx \approx \sum_{i=1}^n f(\bar{x}_i) \Delta x = \Delta x [f(\bar{x}_1) + \dots + f(\bar{x}_n)]$$

where  $\Delta x = \frac{b-a}{n}$  and  $\bar{x}_i = \frac{1}{2}(x_{i-1} + x_i) = \text{midpoints of } [x_{i-1}, x_i]$

Ex) Use the Right endpoint & Midpoint Rule with  $n = 3$

to approximate  $\int_1^2 \frac{1}{x} dx$

1- Using Right Endpoint

$$\Delta x = \frac{b-a}{n} = \frac{2-1}{3} = \frac{1}{3}$$

$$x_0 = a = 1$$

$$x_1 = a + i\Delta x = 1 + 1 \cdot \frac{1}{3} = \frac{4}{3}$$

$$x_2 = x_1 + \Delta x = \frac{4}{3} + \frac{1}{3} = \frac{5}{3}$$

$$x_3 = x_2 + \Delta x = \frac{5}{3} + \frac{1}{3} = 2$$

$$\Delta x [f(x_2) + f(x_1) + f(x_3)] = \frac{1}{3} \left( \frac{1}{4/3} + \frac{1}{5/3} + \frac{1}{2} \right) \approx 0.6167$$

2- Using Midpoint

$$\sum_{i=1}^n f(\bar{x}_i) \Delta x = \sum_{i=1}^3 \frac{1}{\bar{x}_i} \Delta x = \Delta x [f(\bar{x}_1) + f(\bar{x}_2) + f(\bar{x}_3)]$$

$$x_1 = a + i\Delta x = 1 + 1 \cdot \frac{1}{3} = \frac{4}{3}$$

$$\bar{x}_1 = \frac{1}{2}(x_{i-1} + x_i) = \frac{1}{2}(x_0 + x_1) = \frac{1}{2} \left( 1 + \frac{4}{3} \right) = \frac{7}{6}$$

$$\bar{x}_2 = \bar{x}_1 + \Delta x = \frac{7}{6} + \frac{1}{3} = \frac{3}{2}$$

$$\bar{x}_3 = \bar{x}_2 + \Delta x = \frac{3}{2} + \frac{1}{3} = \frac{11}{6}$$

$$\Delta x [f(\bar{x}_1) + f(\bar{x}_2) + f(\bar{x}_3)] = \frac{1}{3} \left( \frac{1}{7/6} + \frac{1}{3/2} + \frac{1}{11/6} \right) \approx 0.6898$$

$$3. \int_1^2 \frac{1}{x} dx = [\ln|x|]_1^2 = \ln 2 - \ln 1 \approx 0.6932$$

$$\text{Ex) } \int_0^2 3x^2 - 2 dx = \left[ \frac{3x^3}{3} - 2x \right]_0^2 = (2^3 - 4) - 0 = 4$$

$$\text{Ex) } \int_0^{\pi/2} \sin x dx = [-\cos x]_0^{\pi/2} = -[\cos \frac{\pi}{2} - \cos 0] = -(0 - 1) = 1$$

$$\begin{aligned} \text{Ex) } \int_{-1}^2 (x - 2|x|) dx &= \int_{-1}^2 x dx - 2 \int_{-1}^2 |x| dx \\ &= \int_{-1}^2 x dx - 2 \left( \int_{-1}^0 -x dx + \int_0^2 x dx \right) \end{aligned}$$

$$\text{Ex) } \int_0^{3\pi/2} |\sin x| dx = \int_0^{\pi} \sin x dx + \int_{\pi}^{3\pi/2} -\sin x dx$$

\*Norm of P = ||P||\*

$$\lim_{n \rightarrow \infty} \|P\| \rightarrow 0 \sum_x^n f(x) \Delta x = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i) \Delta x = \int_a^b f(x) dx$$

**The Fundamental Theorem of Calculus**

Suppose  $f$  is continuous on  $[a, b]$

$$1. \text{ If } g(x) = \int_a^x f(t) dt, \quad \text{then } g'(x) = f(x)$$

$$\text{Ex) } S(x) = \int_0^x \sin(\pi t^2/2) dt \rightarrow S'(x) = \sin(\pi t^2/2)$$

$$2. \int_a^b f(x) dx = \int_a^b F'(x) dx = F(b) - F(a),$$

where  $F$  is any antiderivative of  $f$ , that is,  $F' = f$ .

**The Substitution Rule of Definite Integral**

$$\int_a^b f(g(x)) g'(x) dx = \int_{g(a)}^{g(b)} f(u) du$$

$$1. g(x) = u \quad g'(x) = \frac{du}{dx} \quad g'(x) dx = du$$

$$2. \text{ change interval } [a, b] \rightarrow [g(a), g(b)] \quad \int_a^b ( ) dx \rightarrow \int_{g(a)}^{g(b)} ( ) du$$

$$3. \text{ Don't change } u \rightarrow g(x) \text{ from } \int_{g(a)}^{g(b)} f(u) du$$

$$\begin{aligned} \text{Ex) } \int_0^4 \sqrt{2x+1} dx \quad (2x+1 = u, 2 = \frac{du}{dx}, dx = \frac{1}{2} du \rightarrow g(0) = 1, g(4) = 9) \\ = \int_1^9 u^{1/2} \frac{1}{2} du = \frac{1}{2} \int_1^9 u^{1/2} du = \frac{1}{2} \left[ \frac{2}{3} \cdot u^{3/2} \right]_1^9 = \frac{1}{2} (9^{3/2} - 1^{3/2}) = \frac{26}{3} \end{aligned}$$

$$\begin{aligned} \text{Ex) } \int_e^{e^4} \frac{1}{x\sqrt{\ln x}} dx \quad (\ln x = u, \frac{1}{x} = \frac{du}{dx}, \frac{1}{x} dx = du, \rightarrow \ln e^4 = 4, \ln e = 1) \\ = \int_1^4 u^{-1/2} \frac{1}{x} dx = \int_1^4 u^{-1/2} du = [2u^{1/2}]_1^4 = 2(\sqrt{4} - \sqrt{1}) = 2 \cdot (2 - 1) = 2 \end{aligned}$$

**Integrals of Symmetric functions**

suppose  $f(x)$  is continuous on  $[-a, a]$

$$1. \text{ If } f(x) \text{ is even } [f(-x) = f(x)], \text{ then } \int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx$$

$$2. \text{ If } f(x) \text{ is odd } [f(-x) = -f(x)], \text{ then } \int_{-a}^a f(x) dx = 0$$

**Areas between Curves**

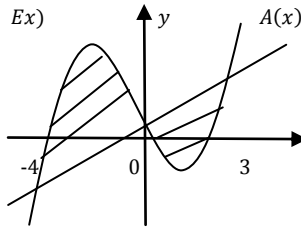

Suppose  $f(x)$  and  $g(x)$  are continuous and  $f(x) \geq g(x)$  for all  $x$  in  $[a, b]$

$$A = \int_a^b [f(x) - g(x)] dx$$

1. to find  $[a, b]$ ; when  $f(x) = g(x) = 0$ ,  $x$  values are  $[a, b]$
2. which is  $f(x)$  or  $g(x)$ ; test any No. between  $[a, b]$

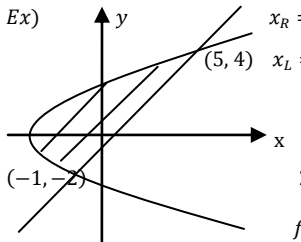

then the bigger func. is  $f(x)$  and the other one is  $g(x)$

$$A = \int_c^d [f(y) - g(y)] dy \quad f(y) \geq g(y) \text{ for all } y \text{ in } [c, d]$$

Ex)   $A(x) = y = x^3 + x^2 + 6x$   
 $B(x) = y = 6x$

 $x$  on  $[-4, 0]$   $A(x) > B(x)$   
 on  $[0, 3]$   $B(x) > A(x)$   

$$\int_{-4}^0 [A(x) - B(x)] dx + \int_0^3 [B(x) - A(x)] dx$$
  

$$\therefore \int_{-4}^0 [(x^3 + x^2 + 6x) - (6x)] dx + \int_0^3 [(6x) - (x^3 + x^2 + 6x)] dx$$

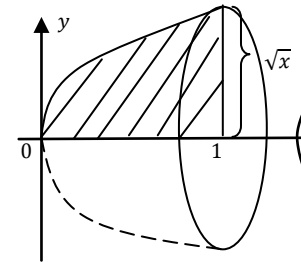

Ex)   $x_R = y + 1$   
 $x_L = \frac{1}{2}y^2 - 3$

 1. Find  $[c, d] = [-2, 4]$   
 2. find  $f(y)$  and  $g(y)$ - test any No. in  $[-2, 4]$   
 $f(0) = 0 + 1 = 1, \quad f(0) = \frac{1}{2} \cdot 0 - 3 = -3$   
 then  $x_R > x_L$   
 3.  $\int_{-2}^4 x_R - x_L dy = \int_{-2}^4 (y + 1) - (\frac{1}{2}y^2 - 3) dy = \int_{-2}^4 (-\frac{1}{2}y^2 + y + 4) dy$   

$$= \left[ -\frac{1}{2} \left( \frac{y^3}{3} \right) + \frac{y^2}{2} + 4y \right]_{-2}^4 = \frac{64}{6} + 8 + 16 - \left( \frac{4}{3} + 2 - 8 \right) = 18$$

**Volume of S**  $V = \lim_{n \rightarrow \infty} \sum_{i=1}^n A(x_i^*) \Delta x = \int_a^b A(x) dx = \int_a^b \pi (f(x))^2 dx$

Let  $S$  be a solid that lies between  $x=a$  and  $x=b$ .

If the cross-sectional area of  $S$  in the plane  $P_x$ , through  $x$  and perpendicular to the  $x$ -axis, is  $A(x)$ , where  $A$  is a continuous func.

 Find the volume of the solid obtained by rotating about  $x$ -axis  

$$V = \int_0^1 A(x) dx = \int_0^1 \pi (f(x))^2 dx$$
  

$$= \int_0^1 \pi (\sqrt{x})^2 dx = \pi \int_0^1 x dx = \frac{\pi}{2}$$

\* radius =  $y = \sqrt{x}$ , height =  $[0, 1]$   
 Ex)  $y = x^3$  bounded by  $y = 8$  &  $x = 0$   
 Find the volume of the solid obtained by rotating about  $y$ -axis  
 $y = x^3 \rightarrow x = \sqrt[3]{y}$   

$$V = \int_0^8 \pi y^{2/3} dy = \pi \left[ \frac{3}{5} y^{5/3} \right]_0^8 = \frac{96\pi}{5}$$

**\* Two functions' case;  $A(x) = \pi(\text{outer func.})^2 - \pi(\text{inner func.})^2$**

Ex) Find the volume of enclosed by curves  $y = x$  &  $y = x^2$  is rotating about the  $x$ -axis  
 1. Find  $[a, b]$   $y = x = x^2, \quad x - x^2 = x(1 - x) = 0$   
 $x = 0$  or  $1 \quad \therefore [a, b] = [0, 1]$   
 2. Find  $f(x) \geq g(x), \quad f(x) = x, \quad g(x) = x^2$   
 3.  $\int_0^1 [\pi x^2 - \pi(x^2)^2] dx = \int_0^1 \pi(x^2 - x^4) dx =$   

$$= \pi \left[ \frac{x^3}{3} - \frac{x^5}{5} \right]_0^1 = \pi \left[ \left( \frac{1}{3} - \frac{1}{5} \right) - 0 \right] = \pi \frac{2\pi}{15}$$

**Volumes by Cylindrical Shells**

$$V = \int_a^b (2\pi x) \cdot (f(x)) \cdot dx = \int_a^b (\text{circumference}) \cdot (\text{height}) \cdot (\text{thickness})$$

The volume of solid obtained by rotating about  $y$ -axis the region under the curve  $y = f(x)$  from  $a$  to  $b$ , where  $0 \leq a < b$

Ex) Find the volume of the solid obtained by rotating about the  $y$ -axis the region bounded by  $y = 2x^2 - x^3$  and  $y = 0$

1. Find  $[a, b]$ ; the radius  $2x^2 - x^3 = x^2(2 - x) = 0$   
 $x = 0$  or  $2 \rightarrow [0, 2]$

**2. Find the Circumference**

It's about  $y$ -axis  $\rightarrow 2\pi x$

**3. Find the height =  $f(x)$**

$$\therefore \int_0^2 (2\pi x)(2x^2 - x^3) dx$$

Ex) Find the volume of the solid obtained by rotating about the  $x$ -axis the region bounded by  $y = \sqrt{x}$   $[0, 1]$

**1. Find  $[a, b]$ ; the radius  $[0, 1]$**

**2. Find the Circumference**

It's about  $x$ -axis  $\rightarrow 2\pi y$

**3. Find the height =  $f(y)$**

Outer func.;  $x = 1$

Inner func.;  $y = \sqrt{x} \rightarrow x = y^2$

Outer func. - Inner func. =  $1 - y^2$

$$\therefore \int_0^1 (2\pi y)(1 - y^2) dy$$

$$= 2\pi \int_0^1 (y - y^3) dy = 2\pi \left[ \frac{y^2}{2} - \frac{y^4}{4} \right]_0^1 = 2\pi \left[ \left( \frac{1}{2} - \frac{1}{4} \right) - 0 \right] = \frac{\pi}{2}$$

**Average Values of Func.**

If  $f$  is continuous on  $[a, b]$ , then there exists a number  $c$  in  $[a, b]$  such that

$$f(c) = f_{ave} = \frac{1}{b-a} \int_a^b f(x) dx$$

that is,  $\int_a^b f(x) dx = f(c)(b-a)$

Ex) Find the average value of the  $f(x) = 1 + x^2$  on  $[-1, 2]$

$$f(c) = f_{ave} = \frac{1}{2 - (-1)} \int_{-1}^2 (1 + x^2) dx = \frac{1}{3} \left[ x + \frac{x^3}{3} \right]_{-1}^2 = 2$$

**Work Problems**

$$\text{velocity} = v = f'(x) = \frac{ds}{dt}$$

$$\text{acceleration} = a = \frac{dv}{dt} = \frac{d}{dt} \frac{ds}{dt} = \frac{d^2s}{dt^2}$$

$$\text{Force} = m \cdot a = m \cdot \frac{d^2s}{dt^2} = m \cdot f''(x)$$

$$\text{Work} = \text{Force} \cdot \text{distance} = W = F \cdot d$$

\*\*  $W$ 's unit is a newton – meter, which is called a joule ( $J$ )

\*The Work done in moving the object from  $a$  to  $b$

$$\text{Work} \approx \sum_{i=1}^n f(x_i^*) \Delta x$$

$$\text{Work} = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x = \int_a^b f(x) dx$$

**Hooke's Law**  $f(x) = k \cdot x$

\*  $k$  is a positive constant (called the **spring constant**)

Ex) A force of  $40N$  is required to hold a spring that has been stretched from its natural length of  $10\text{ cm}$  to  $15\text{ cm}$ .

- Find the spring's force constant.
- How much work is done in stretching the spring from  $15\text{ cm}$  to  $18\text{ cm}$ ?

a) the spring's force constant =  $k$

- Find it from  $f(x) = k \cdot x$
- Change the unit to m(Meter)
- $40N = k \cdot (0.15m - 0.10m) = k \cdot 0.05m$
- $k = \frac{40N}{0.05m} = 800\text{ N/m}$

b) How much work is done  $\rightarrow$  Work ( $J$ )?

- $f(x) = ?$   $f(x) = k \cdot x = 800x$
- $[a, b] = ?$   $[0.05, 0.08]$
- $\int_{0.05}^{0.08} 800x dx = 800 \left[ \frac{x^2}{2} \right]_{0.05}^{0.08} = 400[(0.08)^2 - (0.05)^2] = 1.56\text{ J}$
